▼ Web Site Publishing

Export Destination

☐ Export to disk ☒ Upload to FTP server

FTP server settings:

☒ Put in subfolder:

Full path: /mandator/georges/

Each time you publish an image this plugin will then upload other files that are necessary for your site (HTML, CSS, etc.). For a large site there may be a noticeable delay as these files are updated. This delay can be reduced significantly if the plugin avoids uploading files that it knows haven't changed since the last export.

If you enable this option then you need to understand that the plugin will NOT KNOW if you've manually deleted any of these files on the server, and you'll need to think to come back here to clear the cached information should you make any manual interventions, or if there are any corrupted files.

☒ I understand. Don't upload unchanged files.
